

SpotTheFake - Presentation Script

SpotTheFake - Presentation Script

1) Opener (20-30s)

"Good morning! I'm presenting SpotTheFake, a Streamlit web app that estimates how trustworthy a product's reviews are.

The goal is to give shoppers a quick Trust Score (0-100) so they can spot potentially fake reviews before buying."

2) What the app does (30s)

- Users can log in / sign up (email or phone).
- After login, there's a Home page with a short intro and a button to start.
- In Analyzer, users can either paste a product URL or review text directly.
- The app returns a Trust Score with a color-coded gauge:
Green (≥ 70): High Trust, Amber (40-69): Medium Trust, Red (< 40): Low Trust.
Message: "Reviews appear authentic" vs "High probability of fake reviews."
- Includes Methodology and Team pages.

3) How it works under the hood (60-70s)

- Built using Streamlit for UI + Python logic.
- Session State: Tracks login & current page.
- `generate_stable_score()`: Uses a simple hash to create a stable 0-100 score.
- `display_score_gauge()`: Custom HTML/CSS gauge with color-coded output.
- `login_page()`, `home_page()`, `analyzer_page()`, `methodology_page()`, `team_page()`: Handle UI for each section.
- Sidebar navigation: Home, Analyzer, Methodology, Team, Logout.
- Custom CSS for dark sidebar & styled buttons.

4) Live Demo Plan (45-60s)

1. Login via email.
2. Go to Home -> "Analyze a Product".

3. Paste a product URL -> spinner -> gauge display.

4. Paste some review text -> gauge display.

5. Show Methodology and Team pages.

5) Methodology Talking Points (30-40s)

- Linguistic Analysis: Sentiment, n-gram patterns, readability.
- Behavioral Analysis: Review velocity, reviewer history, text similarity.
- Classifier (e.g., gradient-boosted trees) outputs final Trust Score.

6) Limitations & Future Work (30-40s)

- Current score is deterministic, no real ML.
- Add backend auth, NLP pipeline, review scraping, and database integration.

7) Anticipated Q&A

Q: Why a fake hash score?

A: For stable demo; mirrors real system flow.

Q: How validate real model?

A: Labeled data, precision/recall, cross-validation.

Q: How prevent gaming?

A: Multi-signal analysis + adversarial updates.

Summary:

SpotTheFake is a Streamlit app that demonstrates an end-to-end UX for detecting fake reviews - login, analyzer, Trust Score gauge, and methodology - ready for real ML integration.
